

The background of the slide is a photograph of the TU Delft campus. In the upper left, a tall, modern glass skyscraper (the Streeklift) stands against a clear blue sky. Below and to the right of the skyscraper, there are lush green trees and a paved walkway. In the foreground, a group of people is walking along a path, and a few people are sitting on the grass. The overall scene is bright and sunny, with long shadows cast by the trees and buildings.

Positive and ethical design of ICT for social inclusion of old adults

Alina Pommeranz, Interactive Intelligence, TU Delft

Key issue of ageing populations

- Older people in developed countries increasingly isolated and under-stimulated
- Amplification of common age-related cognitive and physical impairments

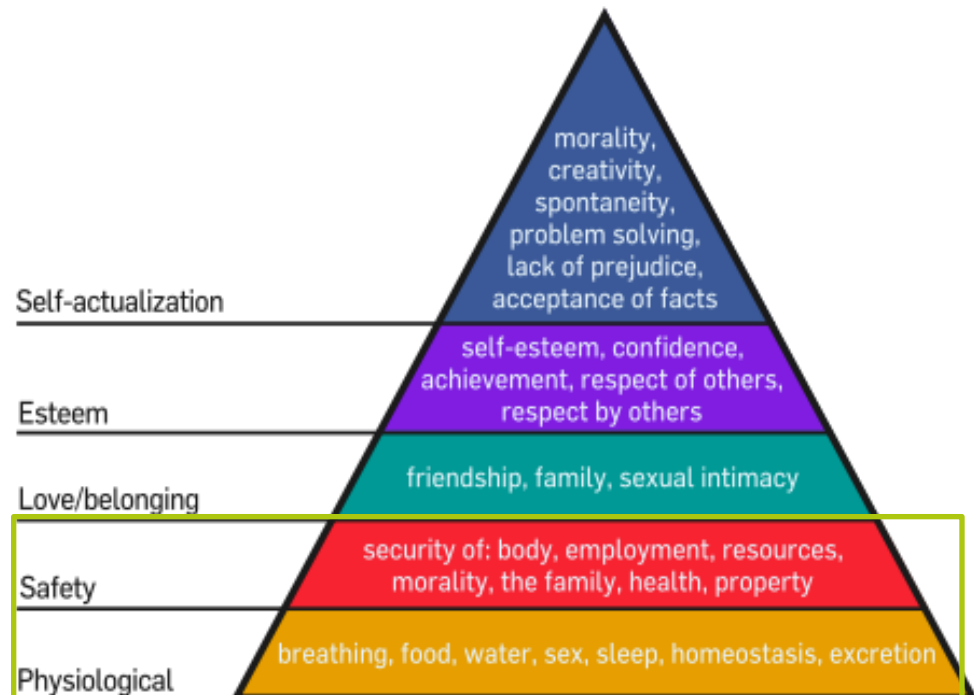

My central research question

How can we design ICT-services (e.g. using smartTVs) that empower older people to *age actively* and remain *socially included*?

Background: Current AAL technologies

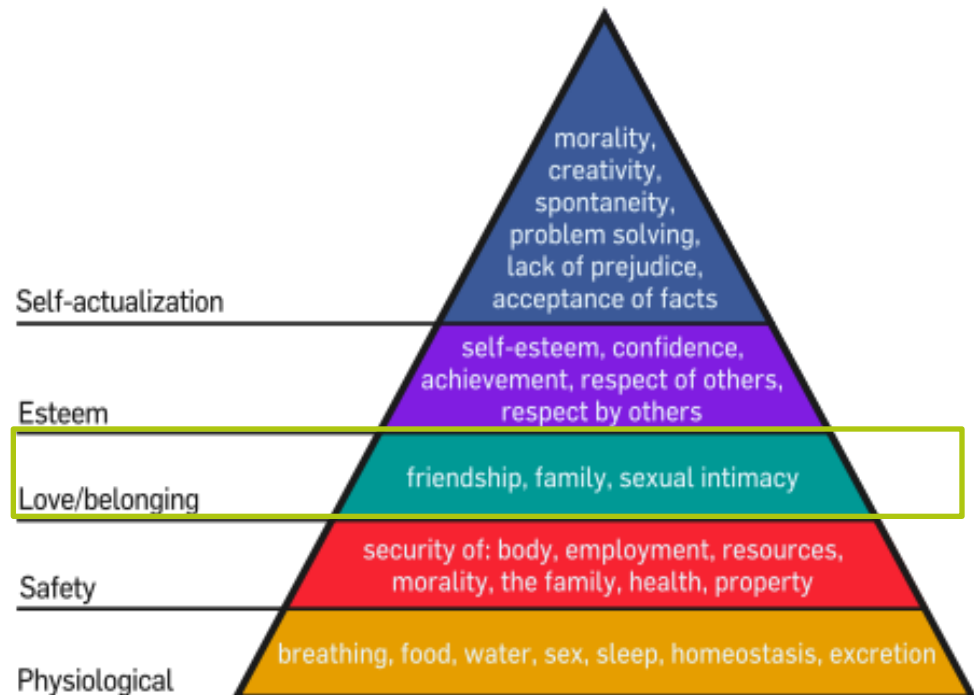

Current ICT for older people

- focus on lower level human needs (physiological/safety needs), e.g. health monitoring, emergency detection

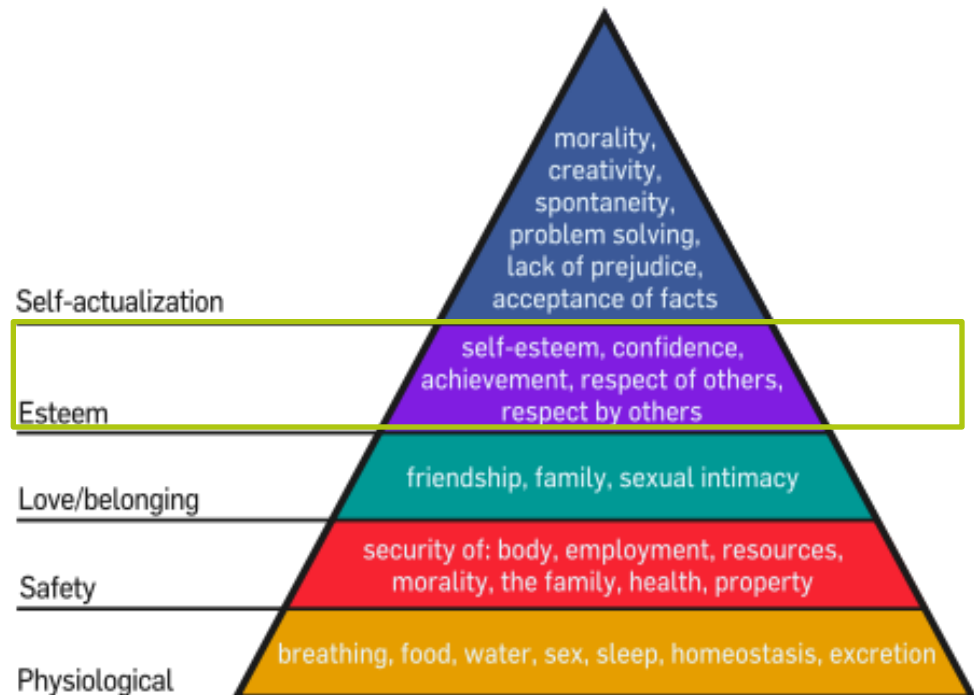

Current ICT for older people

- focus on lower level human needs (physiological/safety needs), e.g. health monitoring, emergency detection
- Recent efforts targeted at connecting old people to social networks

Current ICT for older people

- focus on lower level human needs (physiological/safety needs), e.g. health monitoring, emergency detection
- Recent efforts targeted at connecting old people to social networks
- focus needs to be expanded to include esteem needs

My design approach

My design perspective

- Shifting image of elderly
 - fragile and in need of care → confident, contributing to society
- Focus on *positive* and *ethical* design to promote social inclusion

What is positive design?

- construction of better technologies through discourse that encourages **participative action**
- **instead** of focus on detection of error, treatment of dysfunctions
→ focus on encouraging human strengths and accounting for human values
- taking positive characteristics of ageing as a starting point to create design opportunities
 - Skills, knowledge, experience, time, ...

Avital, M. and Boland, R.J (2008). Managing as Designing with a Positive Lens.

What is ethical design?

- Ethical design considers
 - (1) all stakeholders equally, accounting for strengths, weaknesses and needs
 - (2) stakeholders' values (e.g. independence), their definitions and tensions with other values
 - (3) how systems adapt to users' changing needs and values over time

Value Sensitive Design

A theoretically grounded approach to design of technology that accounts for human values in a principled and comprehensive manner.

- Iterative and integrated conceptual, empirical and technical investigations

Friedman, B., Kahn, P. H., Jr., and Borning, A. (2006). Value Sensitive Design and information systems.

A first conceptual investigation

Independence – a central value in AAL

Independence – a central value in AAL

- Functioning unaided and not being dependent on others
 - *Flexible interpretations* of independence that change over time
 - *Redefining independence*
 - functional ability, **reciprocity**, autonomy, **meaningful** activity, **valued role** and continuity of **identity**
 - Strategies for independence, e.g., adapting self-care practices
 - Home as a prerequisite for maintained independence
- **we should rethink independence (and other values) in AAL projects**

Dependency on assistive devices and caregivers **will remain**, but older people can **still feel independent** as they use ICT-services to engage with and **return value to their community**.

→ **DESIGN FOR RECIPROCITY**

Thank you for your attention!
